LAB 2:

Lab2A_Navigation.png

6-Directory Explanation text block:

`/` (Root): The absolute foundational point of the entire Linux hierarchical filesystem directory tree structure.

`/etc`: Holds all core host-specific system configuration files, startup scripts, and administration settings.

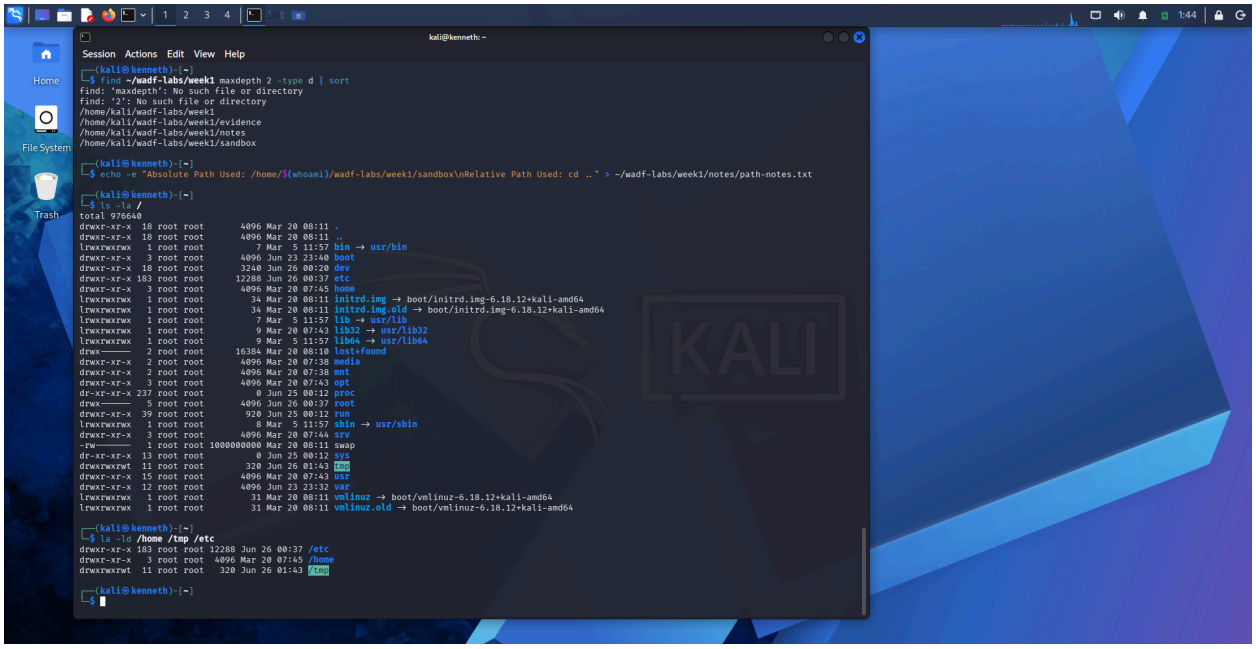

`/var`: Stores variable data files that frequently change dynamically during system operation, such as log metrics, spool directories, and temporary administrative locks.

`/home`: Contains individual user personal storage directories, application preferences, configuration layers, and private documents.

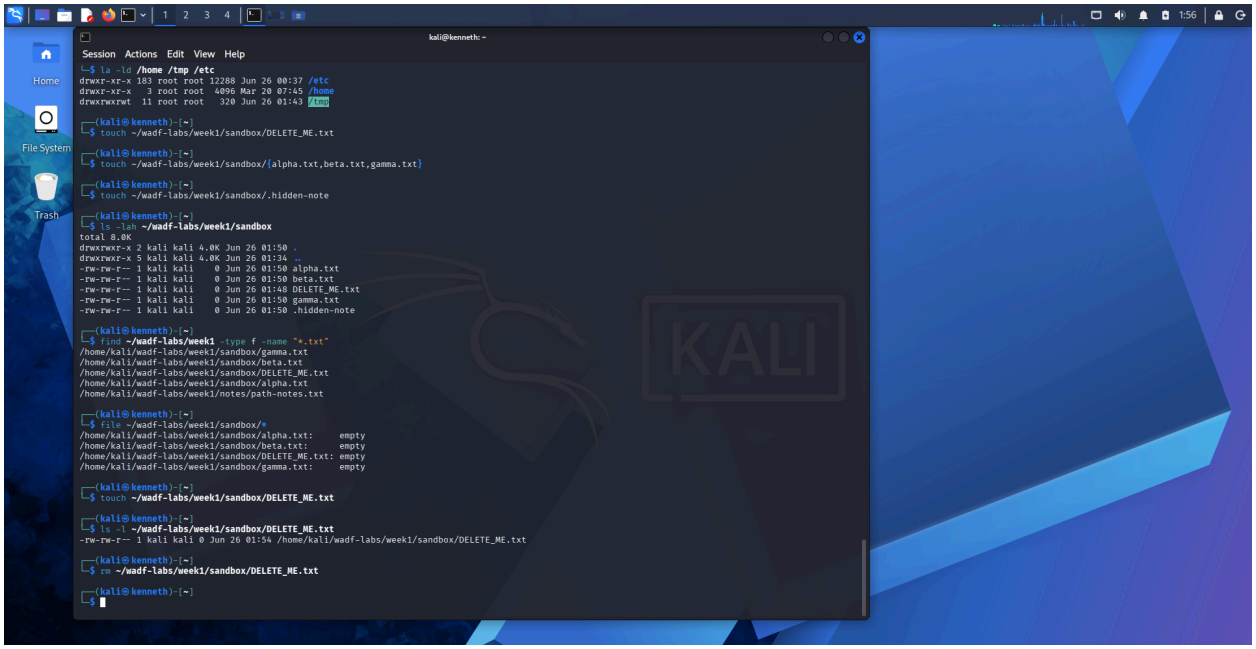

`/tmp`: A global temporary scratch space where applications store short-lived files during active operational routines, accessible by all users but protected by a sticky security permission bit.

`/usr`: Houses user utilities, core shared libraries, read-only system binaries, and program documentation resources.

Note:
I want to express my sincere gratitude for this first weekly laboratory rotation, which has truly opened my eyes to the core realities of Linux administration. To be very honest, managing the command line and putting in all these word prompts felt quite overwhelming at the beginning. But as I pushed through, the work suddenly became very interesting to me. This experience has taught me a great lesson: that with patience, even the hardest commands and prompts can be

remembered, understood, and masterfully controlled. Beyond learning how to check exit statuses or navigate paths, this lab has given me the confidence that I can face difficult technical hurdles without panic.
